

## Automated Poultry Farm

Most farmers have embarked in poultry farming for the ease and high rates of returns in the venture. The chicken reared must be fed and watered on a daily basis. At some instances the chicks undergo clinical procedures such as vaccination and drug dispensation for good health. All these chores have become tiresome, tedious and monotonous. It is even expensive to employ farm attendants. It is in the view of this that we propose to develop an automated poultry farm that will perform the above chores digitally and in a simple automation. The automated farm will perform automated feeding, watering and drug dispensation without human interference. This will save a lot in the use of human resource that has proved to be very expensive and time consuming. This will translate into improved Farm output leading to secure food.
